

VISUALIZE YOUR KEY ALARM & COMMUNICATIONS METRICS

WHAT IS CARESIGHT?

CareSight is a business intelligence software platform developed specifically to analyze and improve patient care. It brings together key analytics from your strategic clinical and communications applications and shows you behaviors and trends using easy-to-understand dashboards.

CareSight was designed to empower care managers, patient experience executives, quality and risk professionals, and hospital leadership by distilling patient care activities and providing meaningful data visualization in real time without manual processing.

By mining critical care-related information housed in different proprietary data silos and then analyzing it, CareSight can give care managers top-level snapshots and compare key performance indicators (KPIs), providing them with insights into their current state and allowing them to monitor and target continuous improvement goals.

HOW DOES CARESIGHT WORK?

CareSight gathers critical information regarding type of calls/alerts received and response times. The software then distills that patient-care data into easy-to-read dashboards and reports that managers can use to reduce risk incidents, improve processes, and provide feedback to underperforming staff members. CareSight can also be used to investigate medical and customer service incidents.

T2 CARESIGHT FEATURES:

- Easy to use without IT assistance
- Shows important and critical data in an easy-to-understand visual manner
- Integrates data from different sources
- Provides real-time and historical performance metrics
- Generates reports automatically
- Allows you to drill down on data
- Includes customizable dashboards and metrics
- Shows behaviors and trends in real time
- Easy retrieval of investigative details for medical or customer care incidents

RESULTS:

- Empowered managers
- Better informed decisions
- More efficient use and allocation of resources
- Higher HCAHPS scores
- Higher reimbursement rates
- Reduced patient safety incidents
- More responsible and quantified care

Have an older nurse call system with no reporting capability? No problem. CareSight can harvest data from many legacy systems.

Our professional services team works with clinical decision makers and patient experience and quality managers to determine key performance indicators (KPIs) and which patient care-related behaviors need to be observed. We then configure CareSight's analytics engine to pull alarm data from your key data points like your alarm middleware, device aggregators, EMR, and nurse call systems.

Once configured, the system provides roles-based web portal access to key users with the dashboards and performance metrics specific to their roles. Additionally, the platform can push critical analytics to line managers and executive leadership via email on a predefined schedule (e.g., daily, weekly, monthly).

With CareSight, organizational leadership and unit level managers can easily observe changes in alarm frequency, duration of alarms, and the time it takes caregivers to respond to them.
